QUASAR MQ200

Designed to produce ice in the most adverse conditions of water quality and in the least adequate sites, the QUASAR machines have an average life span of 18 years. The palette system makes electronics and water filters unnecessary. It produces a semi-hollow cube whose characteristics are compensated for, in order to achieve productive balance.

The QUASAR machines are "tropicalized," so that they can operate in countries with very high average temperatures. And thanks to the absence of thermostats, the QUASAR range also operates at very low temperatures. The manufacturing design is simple, reliable and without electronics. The body is all stainless steel AISI 304 easily detachable, with a collapsible door towards the interior. In the two versions (cooling by air and by water) it is manufactured to 220v/50, 220v/60 and 115v/ 60Hz.

The range of QUASAR machines produces a singular cube, which can also be retouched for convenience. The weight of the ice and the volume it displaces compensate the eyelet visible at one of its ends to ensure maximum productivity.
